**Subject: Vitafoam Polyurethane Foam Classification**

Dear Mr Bryce Macintyre,

This letter hereby confirms that all polyurethane products manufactured by Vitafoam and supplied to the local and export market is safe for the consumer's intended purpose.

The chemicals in their individual state are classified as dangerous, but when the processed and converted to flexible polyurethane the chemicals react together and become inert. The exothermic reaction during the foaming process is in the region of 160 degree Celsius and all micro-organisms are bacteria are destroyed during the reaction. After the Polyurethane foam cures and converted to the customer requirement, the polyurethane foam is a plastic with micro air bubbles, thus making it safe for use. The foam supplied is safe to use in its processed state without being classified as dangerous or toxic.

Should you have any queries or concerns about the above, please do not hesitate to contact me.

Regards,

Leslie Jumna  
Group Technical Manager Vitafoam
